EXECUTIVE DIAGNOSTIC / SELF-ASSESSMENT

Cross-Border Hardware VOC Anomaly & Margin Leakage Checklist

A compact evidence map for leadership teams evaluating whether product-failure signals are visible, attributable and financially material across markets.

Use this as a 20-minute triage. For each line, mark complete only when the underlying record can be retrieved and linked to a product cohort. Unknown is a finding, not a pass.

01 / Signal integrity

- ☐ Join device failures to firmware build, serial range, assembly lot and supplier revision date.
- ☐ Connect return reasons to repair codes, support tickets and inspected returned units.
- ☐ Compare factory QC conditions with field climate, duty cycle and regional use patterns.
- ☐ Preserve raw VOC text with timestamp, locale, SKU and data provenance before clustering.
- ☐ Identify events omitted by vendor dashboards, including retries, stalls and offline states.

02 / VOC anomaly localization

- ☐ Cluster by probable failure mechanism rather than sentiment score alone.
- ☐ Compare symptom language across markets, channels and customer-support taxonomies.
- ☐ Test whether complaint timing shifts after a component or firmware change.
- ☐ Separate verified purchase feedback from general discussion and duplicate reports.
- ☐ Check whether the same root-cause cluster appears in reviews, tickets and returns.

DECISION LAYER / COMMERCIAL EXPOSURE

03 / Margin leakage attribution

- [ ] Reconcile gross sales to contribution margin by SKU, channel and geography.
- [ ] Trace return freight, replacement, refurbishment, warranty and chargeback costs to cohorts.
- [ ] Compare any BOM saving with the full post-sale exposure of the changed component.
- [ ] Use cohort denominators and missing-data ranges before quoting a failure or return rate.
- [ ] Keep an evidence link beside every executive-facing commercial conclusion.

04 / Escalation protocol

- [ ] Freeze source extracts and revision history before asking a vendor to explain the anomaly.
- [ ] Assign one owner to reconcile product telemetry, customer voice and unit economics.
- [ ] Prioritize cohorts where failure signals and margin exposure move together.
- [ ] Prepare a decision packet: observation, evidence quality, financial range and next test.

Decision threshold

Score each evidence layer - product telemetry, VOC and unit economics - as 0 (missing), 1 (partial) or 2 (linked and reviewable). This is a triage aid, not a validated risk model.

EVIDENCE SCORE	NEXT ACTION
0-2 / Records fragmented	Instrument and preserve source data first.
3-4 / Partial joins	Run a focused cohort audit.
5-6 / Decision-ready joins	Quantify exposure and brief leadership.
